Common Name: **Laurel Mastate**

Scientific Name: *Cordia megalantha*

Botanical Family: Boraginaceae

Laurel Mastate is a kind of tree which reaches heights of 30-50 m and diameter of more than 1 m. The trunk is straight with a minimum bifurcation, cylindrical, with small prawns. The crown is dense and conical, narrowly triangular with horizontal branches. The gray to blackish-gray bark, usually with small, light spots, appears in small pieces.

The flowers are arranged in terminal or axillary panicles, 4-5 cm with 5 white petals in inflorescences 6-12 cm long. In March you can see the crown of the tree with thousands of flowers. They produce nectar and are pollinated by bees and other insects.

The brown ellipsoidal fruits ripen in May and June. At this time, the petals turn brown and act as a parachute, contributing to the dispersion by the wind. The seeds are black, having a balloon form, and about 1 cm long.
